A cyber café Point of Sale (PoS) system is easy to install and operate

Many small and rural communities around the world have no access to the Internet and will benefit from the availability of a cyber café to access the Internet. Until now setting up a cyber café has been a complicated process that required very good technical knowledge. Guest Internet has changed that. Anyone who can operate a computer can now install and operate a cyber café using the STAR-12 kit for a very low investment cost. The unique Guest Internet features maintain good Internet performance for many users while ensuring that the ISP requirements are not exceeded.

The number of people that can connect to the Internet at one time depends on the Internet speed. The STAR-12 kit is suitable to connect to an ISP with up to 100Mb/s data speed. Contact us for kits that operate with ISP's up to 300Mb/s.

The GIS-K1 sets rules for Internet access so that the service from one ISP, such as a Starlink antenna, can be shared between many people, and will ensure that the ISP data capacity is not exceeded which may result in a service interruption. The rules include the duration of access, maximum data speed, maximum data volume, and time at which the service can be used. Internet access is provided with a receipt that is printed using the GIS-TP1. The receipt has the access code with the rules for Internet access that include the duration and speed that the customer purchased. The STAR-12 kit includes a comprehensive installation and use document.

GIS-K1 wireless controller with PoS software and GIS-TP1 receipt printer

The GIS-K1 Internet controller with the GIS-TP1 receipt printer has all the software needed for the cyber cafe point of sale system. Add a tablet and optional cash drawer.
